# Introduction

---

## Product Overview

---

The Control™ InterChangeVS™ 3000 virtual remote access server is a rack-mountable or stackable “network appliance” that connects via Ethernet to a host Windows NT® or Novell® NetWare® server and terminates four Basic Rate Interface (BRI) ISDN lines. Each ISDN line (“port”) consists of two 64 Kbps B channels and one 16 Kbps D channel: each B channel can be used independently, for up to eight simultaneous 64 Kbps connections, or the B channels can be bonded, for connections of up to 512 Kbps. This bandwidth, along with the flexible data compression schemes that are supported, makes the VS3000 ideal for site-to-site file transfers and graphics-intensive Internet/intranet applications.

---

## Features

---

- Supports both ISDN Datalink Layer ITU-T Q.921 and ITU-T Q.931 D-channel signaling.
- Supports both North American (VS3000U) and international (VS3000S) users with the same product family and software.
- Provides the performance and features of a standalone remote access server with reduced implementation and operating costs.
- Automatic backup server switching ensures that ISDN services stay available even if the primary server goes down.
- “Hot-swapping” lets you take VS3000 units in or out of service without downing the server or interrupting other network services.
- VS-Link software gives you direct and immediate control of the VS3000, including monitoring and diagnostic functions.
- Full support for Windows NT RAS, Novell NetWare MultiProtocol Router™, and Novell NetWare Connect™ functionality.

### ISDN Service Standards Supported

---

The VS3000U is designed for North American use and is compatible with most ISDN service standards, including:

- AT&T, National ISDN-1 (NI-1), 5ESS Custom, and EuroISDN
- Nortel, NI-1, DMS-100 Proprietary (NTI), and EuroISDN
- Siemens, NI-1, and EuroISDN

The VS3000S is designed for international use, or North American use when connected to an NT1 terminating unit, and is compatible with most international ISDN service standards, including:

- European EuroISDN (ETSI NET-3)
- AT&T, National ISDN-1 (NI-1), 5ESS Custom, and EuroISDN
- Nortel, NI-1, DMS-100 Proprietary (NTI), and EuroISDN
- Siemens, NI-1, and EuroISDN

### Operating System Requirements

---

The InterChangeVS 3000 requires at least one network server\* running one of the following operating systems:

- Windows NT (3.51 or 4.0) with Remote Access Service (RAS or RRAS).

**Note:** *The Windows NT 4.0 operating system is required to support Multilink PPP.*

- Citrix® WinFrame® (1.7 or later)
- Novell NetWare (3.12, 4.11, or IntranetWare™)

**Note:** *Contact Novell Inc. for information regarding Multilink PPP support for NetWare.*

- \* *Two or more network servers are required in order to use the automatic backup server feature.*

### Connectivity Requirements

---

- One to four ISDN BRI telephone lines. (See *Working With The Phone Company*, elsewhere in this guide.)
- An Ethernet connection, either directly to a NIC card in the host server or to an Ethernet hub. (See *Installing the Hardware*, elsewhere in this guide.)

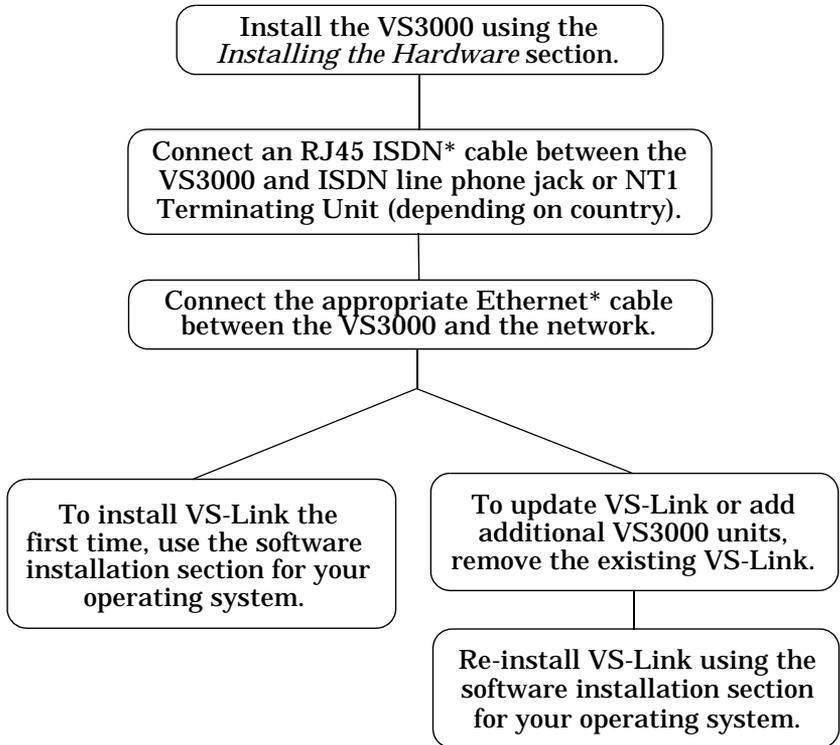

---

## Installation Overview

---

The following figure illustrates the InterChangeVS 3000 hardware and software installation procedure.

**Note:** *The following procedure assumes that the ISDN line is already installed and operational. See the Working with the Phone Company section for more information.*

\* *While ISDN and Ethernet cables may appear to be identical, they are not interchangeable. Make sure you are using the correct cable(s) in the correct locations.*

---

## Backup Server Overview

---

Both the Windows NT and Novell versions of VS-Link support automatic backup server switching. If you have more than one NT or Novell server on a network, you can configure one server as the *primary* server for the VS3000, and one or more other servers as *backup* servers for the same VS3000.

Once configured, primary-to-backup server switching is automatic. In the event that the primary server goes offline, the backup server waits the amount of time you specified during setup. If the primary server does not come back online in that time, the backup server automatically resets the VS3000 (in the process terminating any calls in progress), then reloads the VS3000 using the configuration information stored on the backup server and restores ISDN service.

---

## Backup Server Configuration and Hierarchy

---

To configure backup server operation, you must install the VS-Link software on the primary server and on every server that may be used as a backup server. Then, when you configure the software on a given server, you follow these steps:

1. Select the specific VS3000 to be controlled by this server.
2. Select whether this server is the primary or backup server for the selected VS3000.
3. If a backup server, select the amount of time the server waits (Recover Time in Windows NT, Polling Time in Novell) before taking over from the primary server.

Each VS3000 must have one and only one primary server, but it can have multiple backup servers. Thus, by configuring each potential backup server with a different recover time, you can establish a hierarchy that determines which backup server to go to, and when.

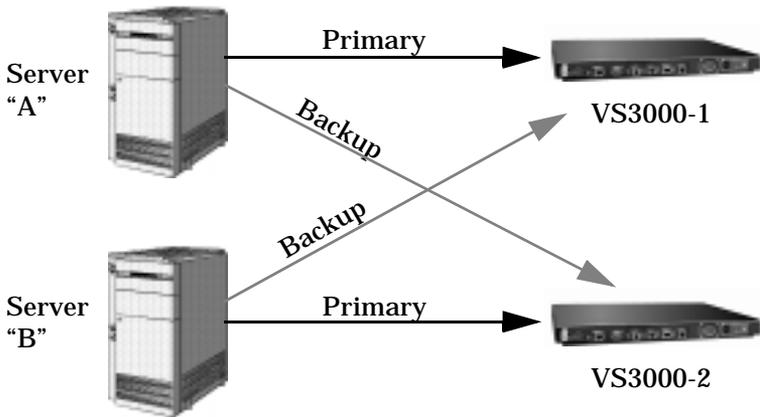

---

## Distributing the Workload

---

Note that primary/backup server configuration is set for *each* VS3000 on the network individually. This means that a given server can be the primary server for some of the VS3000 units on the network, and the backup server for others.

For example, in the following illustration, server "A" is the primary server for VS3000-1 and the backup server for VS3000-2, while server "B" is the primary server for VS3000-2 and the backup server for VS3000-1. Thus, the normal workload is distributed between the two servers, but if one of them goes down, the other takes over support of both VS3000 units.

**Note:** *VS-Link for Novell can support four VS3000 units (either primary, backup, or mixed) per Novell server. VS-Link for Windows NT can support thirty-two VS3000 units per NT server.*

### Returning Control to the Primary Server

When the primary server comes back online after a service outage, backup-to-primary switching is not automatic. Instead, you must go to the primary server and perform a manual procedure to reassert control over the VS3000.

On Windows NT networks, access the **ISDN Monitor** program and use the **Reset** option.

On Novell networks, load the `vs3kcfg.nlm` utility and use the **Primary, Force Load** option.

---

## **Software or Document Updates**

---

For information that is not in this *Guide*, see **README** and/or **Help** files on the installation media. In particular, the Windows NT version of VS-Link and the Windows NT ISDN Monitor program include significant online help.

Control manuals and other documents are available in electronic form on the Control web site. Driver software updates can be downloaded at no charge from the Control ftp site. Always check the web and ftp sites to make sure that you have the current driver and documentation.

The current released version of the software is stored in the **VS3000** directory. If a newer version has reached the beta testing stage, it can be found in the **BETA** directory. Beta software is made available on an **“as-is”** basis and users of beta software assume all risks and liabilities relating thereto.

**Note:** *Downloadable driver software files are stored in either zipped (filename.zip) or self-extracting zip (filename.exe) format. You must extract the zipped files before installing a downloaded file. For more information, see the appropriate section for your network operating system.*

# Installing VS-Link (Novell)

---

## Overview

---

VS-Link for Novell is a NetWare Loadable Module (NLM) that supports the InterChangeVS 3000 virtual server. The VS-Link software works with the following operating system releases:

**Table 1. Novell Operating System Releases Supported**

<b>Operating System</b>	<b>Feature</b>
NetWare 3.12	MPR 3.1A or higher and/or NetWare Connect 2.0.30 or higher
NetWare 4.1x	MPR 3.1A or higher and/or NetWare Connect 2.0.30 or higher
IntranetWare I	NIAS (Support Pack V1.0)

The VS-Link software supports up to four InterChangeVS 3000 virtual servers under the control of a single Novell server. VS-Link also provides for “hot swapping” VS3000 units, in the event that a VS3000 must be replaced with an identical unit while in service, and it supports automatic switching between primary and backup Novell servers, in the event that a host Novell server fails.

The following sections discuss:

- Removing the VS-Link software.
- Installing the VS-Link software.
- Configuring VS-Link for use in a Novell MultiProtocol Router (MPR) environment.\*
- Configuring VS-Link for use in a Novell NetWare Connect (NWC) environment.\*
- Troubleshooting communications with external devices.
- Replacing units in service (“Hot Swapping”)

\* *This includes configuring for primary and backup server operation in a multiple-server environment.*

## Removing VS-Link for Novell

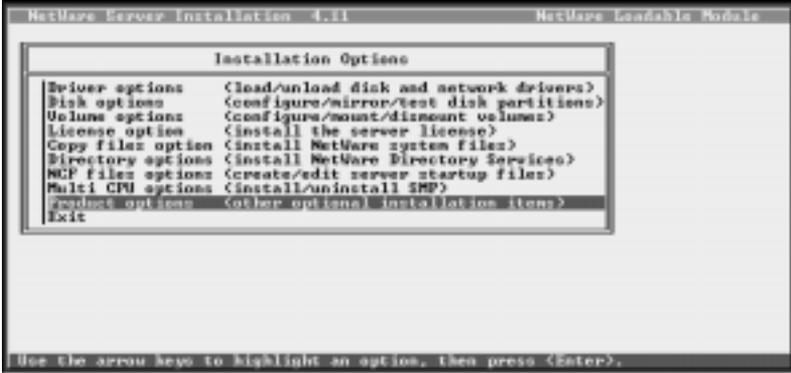

---

If you are installing VS-Link for the first time, skip this section.

If you have an earlier version of VS-Link for Novell installed, follow the instructions below to remove it before installing this version.

1. At the command line prompt, enter `load install`.

The Installation Options menu is displayed:

2. Select **Product options**.

The Other Installation Actions menu is displayed:

3. Select **View/Configure/Remove installed products**.

The list of Currently Installed Products is displayed.

4. Select CAPI3000 Vx.x Control InterChangeVS 3000.
5. Press the Delete key.  
You are asked to verify that you want to delete CAPI3000.
6. Select Yes and press Enter.  
A message displays, informing you that CAPI3000 will be removed from the product database but no files will be removed.
7. Press Enter to continue.  
A message displays, informing you that CAPI3000 was removed.
8. Press Enter to continue.  
The list of Currently Installed Products is displayed.
9. If you are installing a new version of VS-Link, skip to *Installing VS-Link for Novell, Software Installation* subsection, step 4.  
If you are not reinstalling VS-Link, press the Esc key until you exit from the install utility.
10. To unload the module without downing the server, enter:  
**unload capi3000**  
Otherwise, down and restart the server to remove the module.

---

## Installing VS-Link for Novell

---

Use the following procedures to install the VS-Link software for Novell. If updating from an earlier version of VS-Link, make sure that you remove the existing version first.

These procedures assume that you have already installed the hardware and determined that it is working properly. For information about the power-on diagnostics and LED status indicators, see the *Installing the Hardware* and *Troubleshooting* sections.

**Note:** *In a new installation, the lower 10BASE-T LED should be lit (if using a 10Base-T Ethernet connection) and the PORT 1 B1 light should be flashing (waiting for the control program to load).*

---

### Extracting the Files

---

If you are installing from the InterChangeVS 3000 Series diskette supplied with the VS3000 (Part Number: 6620), you do not need to extract files. Skip to *Software Installation*, below.

If you have downloaded VS-Link for Novell from the Control ftp site, you must extract the files and create an installation diskette before you can install VS-Link. Follow these steps:

1. Copy the download file (6622.zip) to a blank, formatted, diskette.
2. On a DOS or Windows client system, use a utility such as PKUNZIP or WinZip to extract 6622.zip to the root directory of the diskette.
3. On a DOS client system, use the label a: command to change the diskette volume label to 6622.

On a Windows client system, use the Properties option to change the diskette label to 6622.

4. Take the diskette out of the client system drive, label it, and move to the network server console.

---

### Software Installation

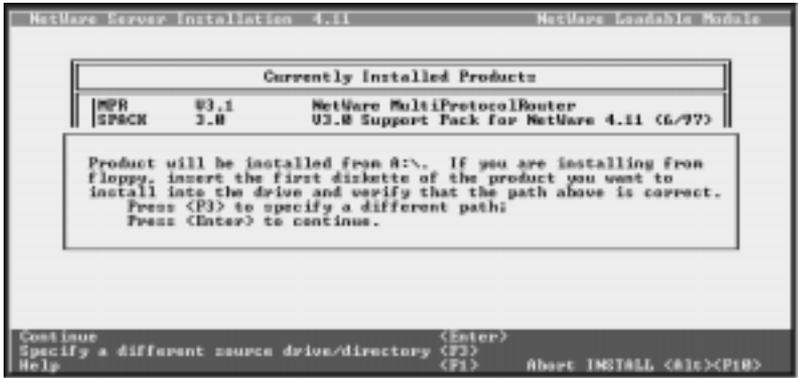

---

On the network server console, follow these steps:

1. At the command line prompt, enter: **load install**  
The Installation Options menu is displayed.
2. Select **Product options**.  
The Other Installation Actions menu is displayed.
3. Select **View/Configure/Remove installed products**.  
The list of Currently Installed Products is displayed.

4. Press the Insert key.

A message displays, telling you to either insert the installation disk in the A:\ drive or specify the path to the installation files:

5. If you are installing from the InterChangeVS 3000 diskette supplied with the VS3000 (Part Number: 6620), follow these steps:
  - a. Place the diskette in the A: drive.
  - b. Press F3. You are prompted to specify a directory path.
  - c. Enter A:\NOVELL and press Enter.

**-OR-**

If you are installing from an installation diskette that you created from a downloaded zip file, follow these steps:

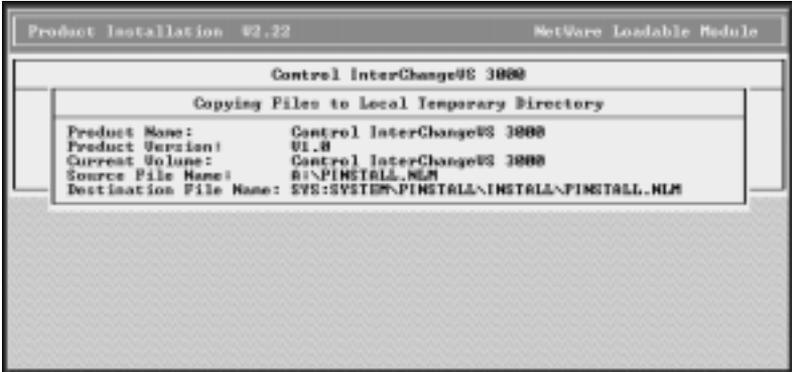

- a. Place the diskette in the A: drive.
- b. Press Enter.

In either case, the installation utility examines the specified drive and directory for the `pscript.dat` installation file. When the file is found, the Comtrol InterChangeVS 3000 Installation Options menu is displayed. At this point you can display the installation log file, display the README file(s), or install the software.

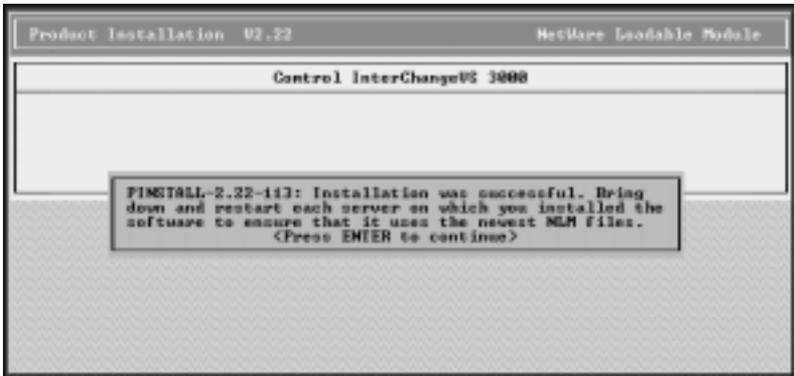

It is good practice to review the README files before proceeding.

- 6. Select **Install on Local Server Only** and press **Enter**. The files are copied to the system:

When file copying is done, a completion message is displayed:

7. Press **Enter** to continue. The Installation Options menu displays.
8. Select **Exit** and press **Enter**. The list of Currently Installed Products is displayed.
9. Press the **Esc** key until you exit from the install utility.
10. If needed, remove the installation media from the floppy drive.
11. Down and restart the server so that your changes take effect.

---

## Configuring MultiProtocol Router (MPR)

---

Use the following procedures to configure the VS3000 to run with MPR 3.1A (or higher) or IntranetWare. These instructions assume that you have already:

- Installed at least one ISDN line
- Installed the VS3000 hardware
- Installed the VS-Link software
- Completed the checklist in the *Working with the Phone Company* section of this manual

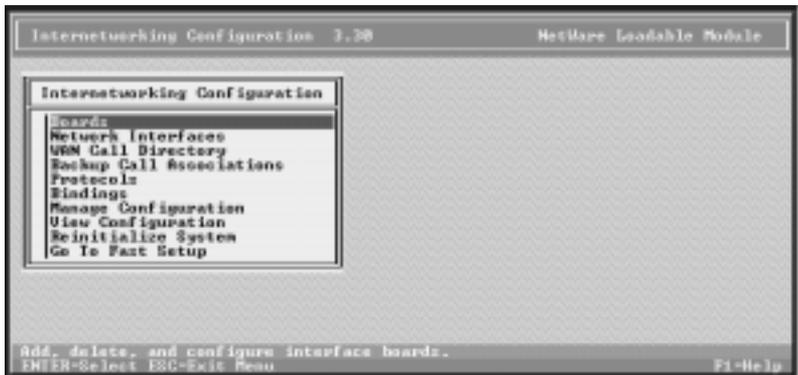

**Note:** Some steps in the following procedure may differ depending upon your version of MPR. For help, press the **F1** key.

To begin, follow these steps:

1. At the command line prompt, enter:

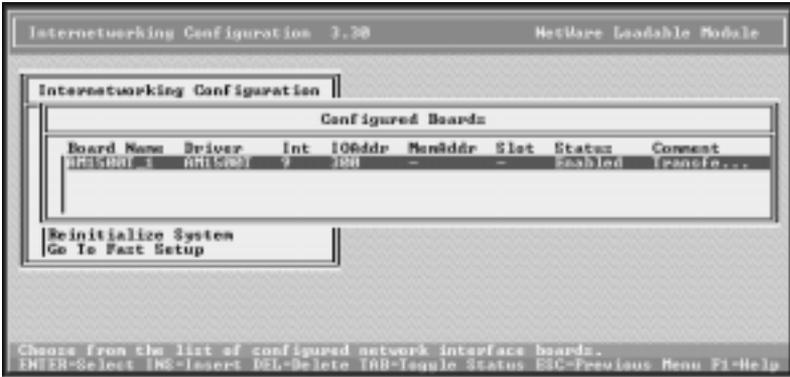

**load inetcfg**

The Internetworking Configuration menu is displayed:

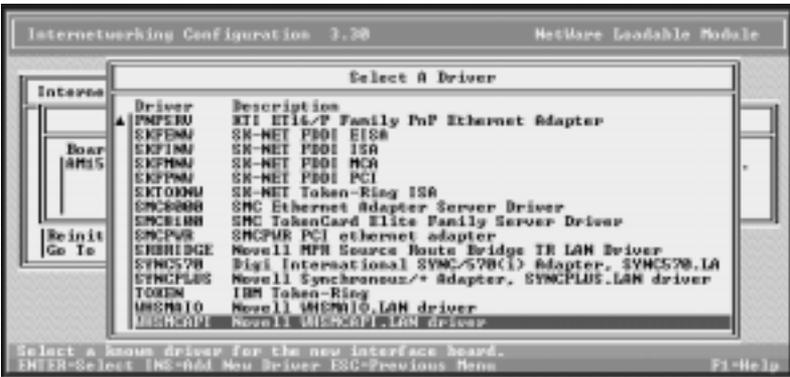

2. Select **Boards**.

The list of Configured Boards is displayed:

- 3. Press the Insert key.

The list of installed drivers is displayed:

- 4. Scroll down the list until WHSMCAPI is displayed, or begin typing in WHSMCAPI and let the system find it. Highlight WHSMCAPI (if needed) and press Enter.

You are prompted to enter a Board Name:

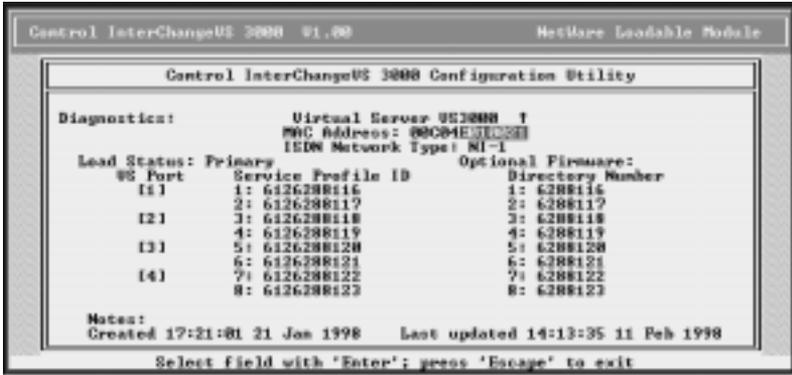

5. Enter a unique name to identify the VS3000 unit and press **Enter**. The WHSMCAPI Board Configuration window is displayed:

6. Select **CAPI Board Options** and press **Enter**. You are asked if INETCFG should automatically load the CAPI driver.
7. Select **Yes** and press **Enter**. The list of available CAPI drivers is displayed.
8. Select **CAPI3000** and press **Enter**. The CAPI Board Configuration window is displayed. MAXPORTS should be set to 8.
9. Press **Esc** to return to the WHSMCAPI Board Configuration window.

10. Select Driver-Specific Configuration and press Enter.

The Control InterChangeVS 3000 Configuration Utility (vs3kcfg.nlm) is launched and the window is displayed:

11. Note or enter the following information:

**Virtual Server <name>:** The unique “board name” you assigned to this VS3000 unit. If this Novell server is currently controlling this VS3000 unit, an up arrow (↑) is displayed. If this Novell server is configured to control this VS3000 but the connection is currently down, a down arrow (↓) is displayed. If no arrow is displayed, this Novell server is not configured to support this VS3000.

**MAC Address:** The unique network address for the VS3000 unit. You will find the network address (MAC) on a label on the back of the unit, near the AUI port. It has the form 00 C0 4E.xx yyyy, where xx is the regional code (01 - North America, 03 - Europe) and yyyy is an hexadecimal ID code. Enter xx and yyyy in the space provided on this screen.

**ISDN Network Type:** Press Enter to display the list of valid ISDN Network Types. Highlight the network type (as supplied by your service provider) and press Enter.

**Load Status:** Press Enter to display the list of valid server load status, then highlight your selection and press Enter. Values are:

**Primary:** This server acquires this VS3000 at startup and always has precedence over backup servers. If a backup server already has operational control of the VS3000, though, this server waits until the VS3000 resets or is abandoned by the backup server before reasserting control.

**Primary, force load:** This option is available only after the server has been configured and the configuration saved. Selecting this option forces the server to preempt any backup servers and assert control over the VS3000. Whenever it does so, the

VS3000 is reset and any calls in progress are terminated. The force load option is executed once, when you exit vs3kcfg, and you are asked to verify that you want to do the forced load.

**Backup, *nn* min polling:** This server will check the VS3000 every *nn* minutes, and if the VS3000 has been abandoned by its primary server (for example, because the primary server is down), the backup server will acquire, reset, reload, and reconfigure the VS3000. You can assign more than one backup server to a given VS3000, and each backup server can use a different polling interval.

**Optional Firmware:** Reserved for future use.

**Service Profile ID 1:** The SPID number for the first B channel on Port 1. This number is supplied by your service provider.

**Directory Number 1:** The Directory Number associated with this SPID.

The remaining Service Profile IDs and Directory Numbers follow in sequence for the B channels on the other VS ports.

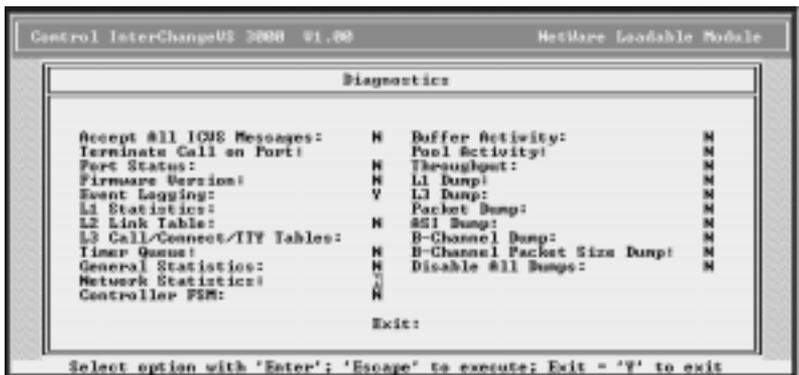

**Notes:** This optional field enables you to enter notes or comments.

**Diagnostics:** Enter Y to activate the VS3000 Diagnostics. (See the following step.)

- When you are finished entering configuration information, press Esc to exit this window.

If you left the Diagnostics field blank, skip to the next step.

If you entered any character in the Diagnostics field, the Diagnostics option window is displayed:

Use the options in this window to enable or disable console logging of VS3000 status and events.

***Note:** Some of these options are one-time-only, while others enable periodic reports that are generated continuously until you use this window again to disable them. Also, be advised that some of these options generate substantial amounts of information and should be used sparingly to avoid affecting system performance.*

For more information on a specific option, use the cursor keys to highlight the option, press Enter to select it, then press F1 to display context-sensitive help.

If all options in this window are set to N, you can press Esc to exit.

If any option in this window is set to Y, you must enter Y in the Exit option, then press Esc to exit.

The Control InterChangeVS 3000 Configuration Utility window is displayed.

13. Press Esc to exit.

You are asked if you want to save the configuration.

14. Select Yes and press Enter.

The WHSMCAPI Board Configuration window is displayed.

If you have selected any diagnostic options, they become effective immediately. For example, if you have enabled event logging, you can press Alt Esc to switch to the console and view the event log.

15. Press Esc. You are asked if you want to save your changes.

16. Select Yes and press Enter.

The Configured Boards window is displayed. It should now show the VS3000 (under the unique name you gave it in step 5), with the WHSMCAPI driver, and with a Status of Enabled.

17. Press Esc to return to the Internetworking Configuration menu.

## Configuring the Network Interfaces

Follow these steps:

1. From the Internetworking Configuration menu, select Network Interfaces.

The Network Interfaces window is displayed:

Note that there is one line for each of the VS3000 B channels.

2. For each channel, follow these steps:
  - a. Press Enter to select the channel. You are prompted to select a medium.
  - b. Select PPP and press Enter. The PPP Network Interface Configuration window displays:

**Note:** MultiLink MPR configurations appear differently, since you can specify more than one network interface ISDN address for a link to another node.

- c. Enter the directory number in the ISDN Address field.
  - d. Enter an ISDN Sub-Address, if provided.
  - e. Select **Modem/DCE Type** and press **Enter**. The list of PPP Modem/DCE Device Types is displayed.
  - f. Select **ISDN(AT Controlled)** and press **Enter**.
  - g. Set **Interface Group, Authentication Options, Timeouts & Retries, Negotiation Options, Enterprise Specific Traps, and Physical Options** as needed. If unsure of the values to use, keep the defaults.
  - h. Press **Esc**. You are asked if you want to save your changes.
  - i. Select **Yes** and press **Enter**. You are returned to the **Network Interfaces** window. The channel should now show a medium of **PPP** and a status of **Enabled**.
  - j. Repeat this process for each channel on the VS3000.
3. When you are done, press **Esc** to exit to the **Internetworking Configuration** menu.

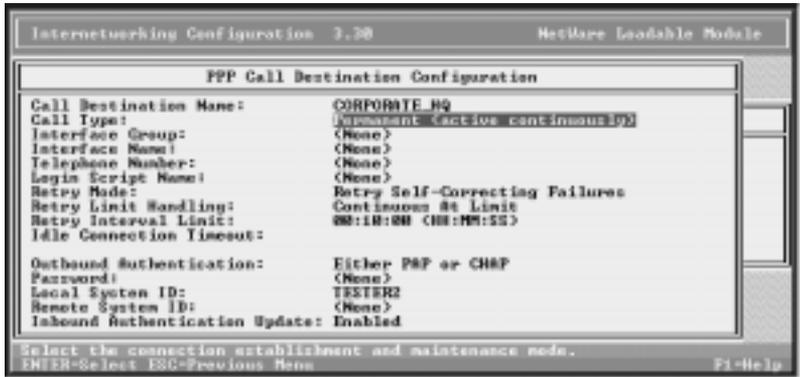

## Configuring the WAN Call Directory

---

The following procedure is an example of a typical setup. Copy and adapt this procedure as needed for your installation.

1. From the **Internetworking Configuration** menu, select **WAN Call Directory**.  
The list of **Configured WAN Call Destinations** is displayed.
2. Press the **Insert** key.  
You are prompted to enter a **New Call Destination Name**.
3. Enter a unique name to identify this destination and press **Enter**.  
You are prompted to choose a supported wide area medium.
4. Select **PPP** and press **Enter**.

The PPP Call Destination Configuration window is displayed:

5. Enter the following information:

**Call Type:** Select Permanent.

**Interface Group:** Press Enter to display and select from the list of defined groups. If no groups are defined, skip this field.

**Interface Name:** If you did not select an Interface Group, press Enter to display and select from the list of enabled PPP interfaces (B channels).

**Telephone Number:** Enter the destination phone number.

**Login Script Name, Retry Mode, Retry Limit Handling, Retry Interval Limit, Idle Connection Timeout:** Use the default values, unless your application requires different values.

**Outbound Authentication:** If required, press Enter to display and select from the list of authentication options.

**Password:** Enter the outbound authentication password expected by the remote peer.

**Local System ID:** The local system server name is displayed. Press Enter to accept it or enter a different name to use when using this WAN configuration to place an outbound call.

**Remote System ID:** Press Enter to display and select from the list of defined Remote System IDs.

**Inbound Authentication Update:** Press Enter to accept the default value of Enabled.

6. Press Esc to exit this window. You are asked if you want to save your changes.
7. Select Yes and press Enter. The list of Configured WAN Call Destinations is displayed.

**Note:** If the prompt “Synchronize the Inbound Authentication Database?” appears, select Yes.

- Repeat steps 2 through 7 for each interface group or interface name you need to configure.
- When you are done configuring WAN call destinations, press Esc to return to the Internetworking Configuration menu.

### Configuring Protocols

---

Follow these steps:

- Select **Protocols** from the Internetworking Configuration menu. The list of supported protocols is displayed:

- Select **CAPI VS3000** and press **Enter**. The Miscellaneous Protocol LOAD Commands list is displayed.
- Press **Insert**. The Protocol Command Configuration window is displayed.
- Enter **CAPI3000** as the NLM Name. No parameters are required.
- Press **Esc**. You are asked if you want to save your changes. Select **Yes** and press **Enter**. The Miscellaneous Protocol LOAD Commands list is displayed.
- Press **Esc** to return to the Protocol Configuration window.
- Enable **IPX** and other protocols as needed.
- When finished, press **Esc** to return to the Internetworking Configuration menu.

## Configuring Bindings

---

Follow these steps:

1. Select **Bindings** from the Internetworking Configuration menu.  
The list of Protocol To Interface/Group Bindings is displayed.
2. Press the **Insert** key.  
The list of configured protocols is displayed.
3. Select **CAPI VS3000** and press **Enter**.  
You are asked to select the interface to which the protocol is bound.
4. Select **A Network Interface** and press **Enter**.  
You are asked to select a configured network interface.
5. Select the name you assigned to this VS3000 and press **Enter**.  
The Binding a Miscellaneous Protocol to an Interface window is displayed.
6. If additional bindings are needed, enter the protocol and command line parameters here. When done, press **Esc** to close the window.  
The list of Protocol to Interface/Group Bindings is displayed.
7. Select **IPX** and press **Enter**.  
The Binding IPX to a LAN Interface window is displayed.
8. Examine the default parameters and change them if needed.
9. Press **Esc** to return to the Protocol To Interface/Group Bindings window.
10. Press **Esc** to exit to the Internetworking Configuration menu.

## Exiting from inetcfg

---

Changes made in inetcfg do not take effect immediately. To put your new configuration into effect you must either:

- Select **Reinitialize System** from the Internetworking Configuration menu, then press **Esc** to exit the configuration program.  
-OR-
- Press **Esc** to exit the configuration program, then down and restart the server.

**Note:** *As a rule, downing and restarting the server is the surest way of forcing all configuration changes to take effect.*

---

## Configuring NetWare Connect (NWC)

---

Use the following procedures to configure the VS3000 to run with NetWare Connect. These instructions assume that you have already:

- Installed at least one ISDN line
- Installed the VS3000 hardware
- Installed the VS-Link software
- Completed the checklist in the *Working with the Phone Company* section of this manual

**Note:** *Some of the steps in the following procedure may differ depending upon your version of NWC. For help, press the F1 key.*

To begin, follow these steps:

1. At the command line prompt, enter:

`load nwcon`

The NetWare Connect Options menu is displayed:

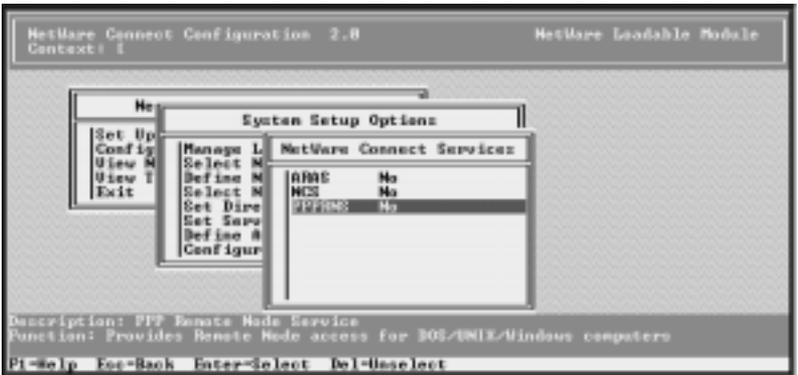

2. Select Set Up NetWare Connect.

The System Setup Options menu is displayed:

3. Select Select NetWare Connect Services.

The NetWare Connect Services window is displayed:

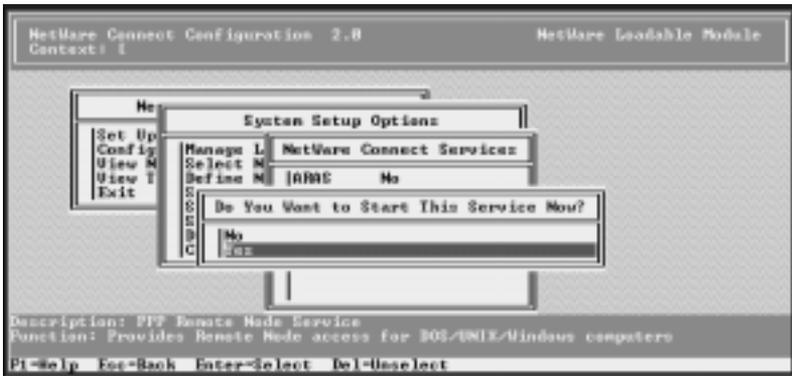

4. Highlight PPRNS and press Enter.

The List of Protocols for Service is displayed:

- 5. Select and configure IPX and/or IP as needed.
- 6. When finished, press Esc. You are asked if you want to save the current settings to file.
- 7. Select Yes and press Enter.

You are asked if you want to start the service now:

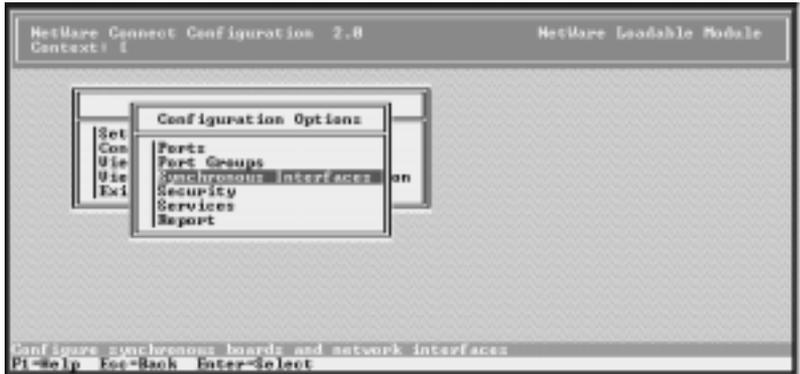

- 8. To start the service immediately, select Yes and press Enter. If you select No, the service will start the next time that the system is downed and restarted. After you make a selection, the PPRNS status should be set to Yes.
- 9. Press Esc twice to return to the Netware Connect Options menu.

## NetWare Connect Configuration Options

Follow these steps:

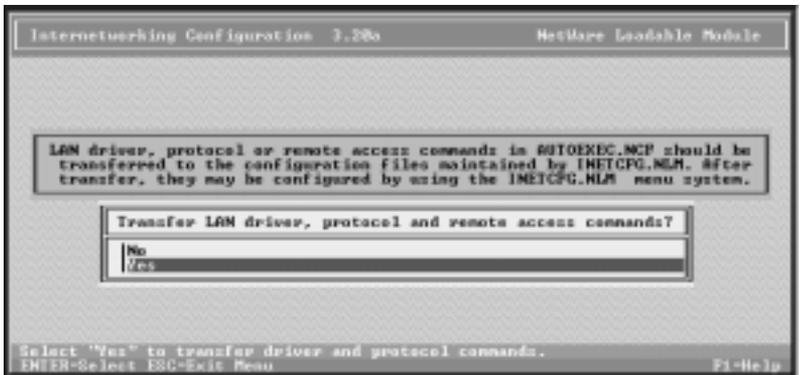

1. From the NetWare Connect Options menu, select **Configure NetWare Connect**.

The Configuration Options menu is displayed:

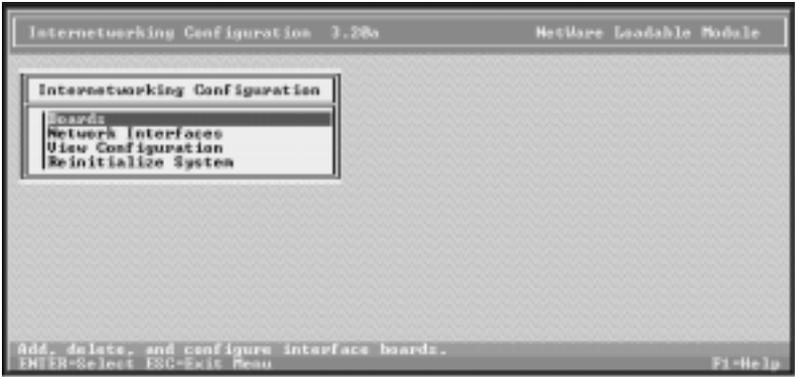

2. Select **Synchronous Interfaces**.

You are asked if you want to transfer commands.

3. Select **Yes** and press **Enter**.

The configuration program (INETCFG.NLM) is launched and the Internetworking Configuration menu is displayed:

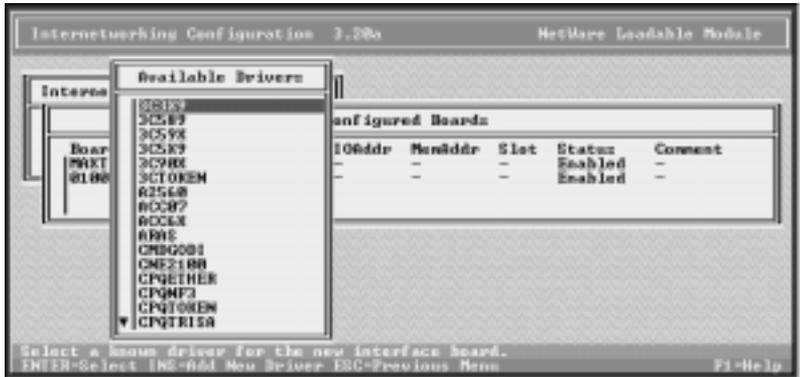

4. Select Boards.

The list of configured boards is displayed:

5. Press the Insert key.

The list of available drivers is displayed:

6. Scroll down the list until WHSMCAPI is displayed, or begin typing in WHSMCAPI and let the system find it. Highlight WHSMCAPI (if needed) and press Enter.

You are prompted to enter a board name.

7. Enter a unique name to identify the VS3000 unit and press Enter. The WHSMCAPI Board Configuration window is displayed:

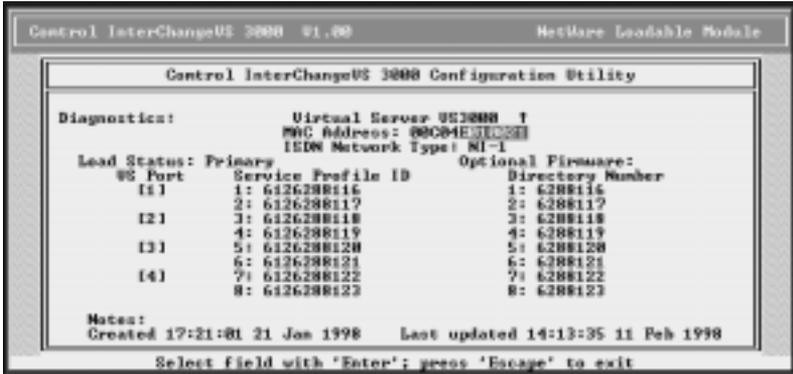

8. Select CAPI Board Options and press Enter. You are asked if INETCFG should automatically load the CAPI driver.
9. Select Yes and press Enter. The list of available CAPI drivers is displayed.
10. Select CAPI3000 and press Enter.

The CAPI Board Configuration window is displayed. MAXPORTS should be set to 8.

11. Press Esc to return to the Board Configuration window.
12. Select **Driver-Specific Configuration** and press Enter.

The **Control InterChangeVS 3000 Configuration Utility (vs3kcfg.nlm)** is launched and the window is displayed:

13. Note or enter the following information:

**Virtual Server <name>:** The unique “board name” assigned to this VS3000 unit. If this Novell server is currently controlling this VS3000 unit, an up arrow (↑) is displayed. If this Novell server is configured to control this VS3000 but the connection is currently down, a down arrow (↓) is displayed. If no arrow is displayed, this Novell server is not configured to support this VS3000.

**MAC Address:** The unique network address (MAC) label on the back of the unit, near the AUI port. It has the form 00 C0 4E.xx yyyy, where xx is the regional code (01 - North America, 03 - Europe) and yyyy is an hexadecimal ID code. Enter xx and yyyy in the space provided on this screen.

**ISDN Network Type:** Press Enter to display the list of valid ISDN Network Types. Highlight the network type (as supplied by your service provider) and press Enter.

**Load Status:** Press Enter to display the list of valid server load status, then highlight your selection and press Enter. Values are:

**Primary:** This server acquires this VS3000 at startup and always has precedence over backup servers. If a backup server already has operational control of the VS3000, though, this server waits until the VS3000 resets or is abandoned by the backup server before reasserting control.

**Primary, force load:** This option is available only after the server has been configured and the configuration saved. Selecting this option forces the server to preempt any backup servers and assert control over the VS3000. When it does so, the VS3000 is reset and any calls in progress are terminated. The force load option is executed once, when you exit `vs3kcfg`, and you are asked to verify that you want to do the forced load.

**Backup, *nn* min polling:** This server will check the VS3000 every *nn* minutes, and if the VS3000 has been abandoned by its primary server (for example, because the primary server is down), the backup server will acquire, reset, reload, and reconfigure the VS3000. You can assign more than one backup server to a given VS3000, and each backup server can use a different polling interval.

**Optional Firmware:** Reserved for future use.

**Service Profile ID 1:** The SPID number for the first B channel on Port 1. This number is supplied by your service provider.

**Directory Number 1:** The Directory Number associated with this SPID.

The remaining Service Profile IDs and Directory Numbers follow in sequence for the B channels on the other VS ports.

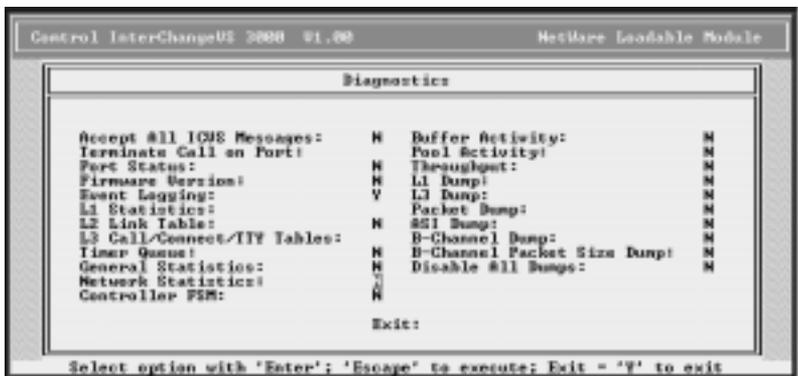

**Notes:** This optional field enables you to enter notes or comments.

**Diagnostics:** Enter Y to activate the VS3000 Diagnostics. (See the following step.)

- Press Esc to exit this window when you are finished entering configuration information.

If you left the Diagnostics field blank, skip to the next step.

If you entered any character in the Diagnostics field, the Diagnostics option window is displayed:

Use the options in this window to enable or disable console logging of VS3000 status and events.

***Note:** Some of these options are one-time-only, while others enable periodic reports that are generated continuously until you use this window again to disable them. Also, be advised that some of these options generate substantial amounts of information and should be used sparingly to avoid affecting system performance.*

For more information on a specific option, use the cursor keys to highlight the option, press **Enter** to select it, then press **F1** to display context-sensitive help.

If all options in this window are set to **N**, you can press **Esc** to exit.

If any option in this window is set to **Y**, you must enter **Y** in the **Exit** option, then press **Esc** to exit.

15. Press **Esc** to exit when the **Control InterChangeVS 3000 Configuration Utility** window is displayed.

You are asked if you want to save the configuration.

16. Select **Yes** and press **Enter**.

The **WHSMCAPI Board Configuration** window is displayed.

If you have selected any diagnostic options, they become effective immediately. For example, if you have enabled event logging, you can press **Alt Esc** to switch to the console and view the event log.

17. Press **Esc**.

You are asked if you want to save your changes.

18. Select **Yes** and press **Enter**.

The **Configured Boards** window is displayed. It should now show the **VS3000** (under the unique name you gave it in step 7), with the **WHSMCAPI** driver, and with a **Status of Enabled**.

19. Press **Esc** to return to the **Internetworking Configuration** menu.

## Configuring Interfaces

Follow these steps:

1. Select **Network Interfaces** from the Internetworking Configuration menu.

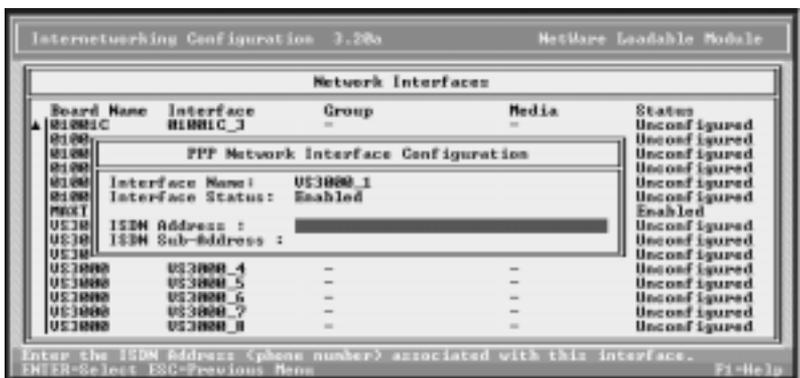

The Network Interfaces window is displayed:

**Note:** There is one line for each of the VS3000 B channels.

2. For each channel, follow these steps:
  - a. Press **Enter** to select the channel.  
You are prompted to select a medium.
  - b. Select **PPP** and press **Enter**.

The PPP Network Interface Configuration window displays:

- c. Enter the directory number in the ISDN Address field.

- d. Enter an ISDN Sub-Address, if provided.
  - e. Press Esc. You are asked if you want to save your changes.
  - f. Select **Yes** and press **Enter**. You are returned to the Network Interfaces window. The channel should now show a medium of **PPP** and a status of **Enabled**.
  - g. Repeat this process for each channel on the VS3000.
3. When you are done, press Esc to exit to the Internetworking Configuration menu.
  4. Press Esc to exit from the configuration utility. You are asked to confirm that you want to exit INETCFG.
  5. Select **Yes** and press **Enter**.  
The Configuration Options menu is displayed.

## Configuring Network Security

---

Use the Security option on the Configuration Options menu is set up user and port restrictions and set remote client passwords as needed. For more information, press F1 to see the online help.

## Configuring NWCAP, PAP, and CHAP

---

Follow these steps:

1. Select **Services** from the Configuration Options menu. The list of available NetWare Connect Services is displayed.
2. Select **PPRNS**.  
The PPRNS Configuration Options menu is displayed.
3. Select **Configure Security**.  
The PPRNS Security Configuration menu is displayed.
4. Press **Enter** to toggle between **Enable** and **Disable**.  
After PPRNS security is enabled, you can toggle NetWare Connect Authentication Protocol (NWPAP), Password Authentication Protocol (PAP), and Challenge Handshake Authentication Protocol (CHAP).
5. When you are done, press Esc. You are asked if you want to save your changes.
6. Select **Yes** and press **Enter**.  
The PPRNS Configuration Options menu is displayed.
7. Select **Exit**, or press Esc. You are asked to confirm that you want to exit PPRNS configuration.

8. Select **Yes** and press **Enter**.
9. Press **Esc** twice to return to the NetWare Connect Options menu.
10. Select **Exit**, or press **Esc**. You are asked to confirm that you want to exit NWCCON.
11. Select **Yes** and press **Enter**.  
You are returned to the system console.

## **Configuring Protocols**

---

Follow these steps:

1. At the command line prompt, enter:  
**load inetcfg**  
The Internetworking Configuration menu is displayed.
2. Select **Protocols**.  
The Protocol Configuration menu is displayed.
3. Select **CAPI VS3000**.  
The Miscellaneous Protocol LOAD Commands list is displayed.
4. Press **Insert**.  
The Protocol Command Configuration window is displayed.
5. Enter **CAPI3000** for NLM Name. No parameters are required.
6. Press **Esc**. You are asked if you want to save your changes. Select **Yes** and press **Enter**.  
The Miscellaneous Protocol LOAD Commands list is displayed.
7. Press **Esc** to return to the Protocol Configuration window.
8. Press **Esc** to return to the Internetworking Configuration menu.

## Binding CAPI3000 to the Ethernet Board

---

The InterChangeVS 3000 links to the server by Ethernet. Follow these steps to bind the protocol to the Ethernet (NIC) board:

1. Select **Bindings** from the Internetworking Configuration menu.

The list of Protocol To Interface/Group Bindings is displayed:

2. Press the Insert key.

The list of configured protocols is displayed:

3. Select CAPI VS3000 and press Enter.

The list of configured network interfaces is displayed:

4. Select the desired Ethernet board and press Enter.

The binding information window is displayed:

5. Enter the following information:

**Status:** Enabled

**Protocol:** CAPI3000

**Frame Type:** Press Enter to display and select from the list of available frame types. Select Ethernet\_II and press Enter.

6. Press Esc to exit this window. You are asked if you want to save your changes. Select Yes and press Enter.

The Protocol To Interface/Group Bindings window is displayed.

## Binding IP/IPX to the VS3000 Ports

---

Follow these steps. (IPX is used as an example. In your installation you may be configuring IP. Copy this procedure and adapt as needed.)

1. Beginning at the Protocol To Interface/Group Bindings window, press **Insert**.

The list of configured protocols is displayed.

2. Select **IPX** and press **Enter**.

The list of configured network interfaces is displayed:

3. For each configured port, do the following:
  - a. Select the next available PPP port on the VS3000. The Binding IPX to a WAN Interface window is displayed.
  - b. Press **Esc** to close this window. You are asked if you want to save IPX bind parameters.
  - c. Select **Yes** and press **Enter**.
4. When you are finished with all ports, press **Esc** to return to the Protocol To Interface/Group Bindings window.
5. Press **Esc** to return to the Internetworking Configuration menu.
6. Press **Esc** to exit INETCFG. You are asked to confirm that you want to do so. Select **Yes** and press **Enter**.
7. Down and restart the server, so that your changes take effect.

## Editing AUTOEXEC.NCF

---

Depending on your current system status and configuration, these steps may not be necessary:

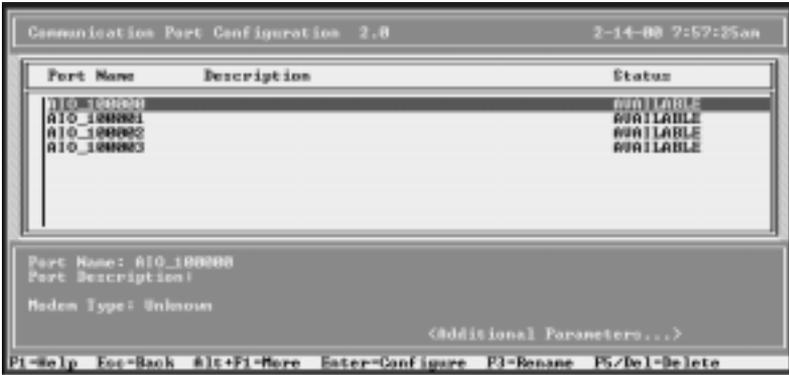

1. At the command line prompt, enter:  
**load install**  
The Installation Options menu is displayed.
2. Select **NCF files options**.  
The Available NCF Files Options menu is displayed.
3. Select **Edit AUTOEXEC.NCF file**.
4. Scroll through the file, and verify that the following command appears at or near the end of the file:  
**nwstart**
5. If the command is in the file, press **Alt F10** to exit install.  
If the command is not in the file, add it, then press **F10** to save the file and exit to the Available NCF Files Options menu. Press **Esc** to exit install.

## Selecting ISDN Modem Type

---

Follow these steps:

1. At the command line prompt, enter:  
**load nwcon**  
The NetWare Connect Options menu is displayed.
2. Select **Configure NetWare Connect**.  
The Configuration Options menu is displayed.
3. Select **Ports**.  
The list of configured ports is displayed:

4. For each port, do the following:
  - a. Select the port and press **Enter**. The highlight moves to the lower window.
  - b. Select **Modem Type** and press **Enter**. The list of modem types is displayed.
  - c. Select **ISDN (AT Controlled)** and press **Enter**.
5. When you have finished configuring modems, press **Esc** until you exit from `nwcon`.
6. Down and restart the server.

### Verifying Installation

---

To verify the VS3000 installation and configuration, follow these steps:

1. At the command line prompt, enter: `load nwcon`.
2. Select **View NetWare Connect Status** from the NetWare Connect Options menu.
3. Select **Display Port Status** from the Status Options menu.  
All configured ports should appear, with a status of *Waiting*.
4. Press **Esc** until you exit from `nwcon`.

You are now ready to begin normal NetWare Connect server operations.

---

## Tracing and Troubleshooting

---

If you encounter installation problems, there are several software tools that may help you identify and resolve installation issues. Also remember that the VS3000 has built-in hardware diagnostics, as described in the “Installing the Hardware” and “Understanding the LEDs” sections of this guide.

---

### CAPITEST and CAPITRACE

---

These are advanced diagnostic modules that can disable your system if used incorrectly. Therefore, use them only when directed to do so by Control technical support.

---

### PPPTRACE and CALLMGR

---

PPPTRACE.NLM is a real-time monitor and data-capture utility. When used with CALLMGR.NLM, it can be used to verify that:

- The connection works.
- The directory numbers are correct.
- The SPIDs are correct.
- The switch vendor is correct.
- The network type is correct.

These utilities are supplied by Novell. For more information, see the Novell documentation.

---

### VS3KCFG

---

The configuration utility (`vs3kcfg.nlm`) discussed earlier in this chapter is normally accessed through `inetcfg`, but can also be run standalone. To do so, enter this at the command line:

```
load vs3kcfg CAPINAME=<board name>
```

where *<board name>* is the unique name assigned to the VS3000.

After this command is entered, the Control InterChangeVS 3000 Configuration Utility screen is displayed. Follow the instructions earlier in this chapter for activating and executing the diagnostics, or press F1 to access the online help.

**Note:** *Most of the diagnostic options are Y/N toggles. Options with a blank entry field require a VS3000 port number (1-4) entry. For example, to generate the L1 Statistics report for port 1, enter 1.*

All diagnostic reports are made to the console log. If you select multiple reports, press Alt Esc to switch between console screens.

---

## Replacing Units in Service (“Hot-Swapping”)

---

In the event that a VS3000 needs to be removed from service, it is possible to replace it with another VS3000 without taking down the server. To do so, follow this procedure:

1. Connect the replacement VS3000 to power and Ethernet and verify that it passes the power-on diagnostics.
2. Terminate any calls in progress.
3. At the command line prompt, enter: **load install**.  
The Internetworking Configuration menu is displayed.
4. Select **Boards**.  
The list of Configured Boards is displayed.
5. Select the VS3000 to be replaced.  
The WHSMCAPI Board Configuration window is displayed.
6. Select **Driver-Specific Configuration**.  
The **Control InterChangeVS 3000 Configuration Utility (vs3kcfg.nlm)** is launched and the window displayed.
7. Verify that the Network Address (MAC) displayed is the address of the VS3000 you are taking out of service.
8. Enter the Network Address of the replacement VS3000 and press **Enter**.
9. Swap the ISDN cables from the old VS3000 to the replacement VS3000, if needed.
10. Press **Esc** to exit the configuration utility. You are asked if you want to save your changes.
11. Select **Yes**. You are asked if you want to reset and reconfigure now.
12. Select **Yes**. The CAPI service is reset, and the WHSMCAPI Board Configuration window is displayed.
13. Press **Esc** to exit from **inetcfg**.
14. Power down the VS3000 you are removing from service and disconnect it from the network.

You are now ready to resume normal operations.

# Troubleshooting

This section discusses the following topics:

- Isolating and resolving problems
- Understanding the LED displays
- Obtaining software and/or document updates
- Placing a call to Control Technical Support

---

## Problem Resolution Checklist

---

If installation fails or the VS3000 does not operate as expected, try the following before calling the Control technical support line:

- Check for proper cable connections. In particular, check to make sure that you have an *Ethernet* cable on the Ethernet port and *ISDN* cables on the ISDN ports. The two types of cables are easy to swap by accident.
- Turn the VS3000 on and off and watch for errors on the LEDs using the *Understanding the LEDs* subsections. (These are found on the following pages.)
- Check the VS-Link software to make sure that the Network Address (MAC) in the software matches the Network Address on the VS3000.
- Verify that you have the correct model (VS3000U or VS3000S) for your locale. The VS3000U is for North American use only. The VS3000S is for international use, but requires an NT1 terminating unit. For more information see *Installing the Hardware*.
- If you are operating in a multiple-server environment, check to make sure that you are controlling the VS3000 from its *primary* server, that there is only *one* primary server assigned to this particular VS3000, and that no backup server has pre-empted the primary server.

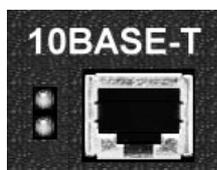

**Note:** *Backup-to-primary switching is not automatic. Once a backup server takes over control of a VS3000, you must follow a manual procedure to restore control to the primary server. This procedure differs depending on your network operating system. See the chapter for your operating system for more information.*

- If you are operating in a multiple-server environment and a backup server has taken over control of the VS3000, check (if possible) to make sure the backup server has the same Port, SPID, Directory Number, and MAC configuration as the primary server.
- If this is a Windows NT installation, use the **ISDN Monitor** program to trace and log the messages being passed between the NT server and the VS3000. Use the *ISDN Cause Codes* section of this manual to interpret the results. Also note that other error messages may be displayed in the **Event Log**.
- If this is a Novell installation, use the **vs3kcfg.nlm** utility to trace and log the messages between passed between the server and the VS3000. Use the *ISDN Cause Codes* section of this manual to interpret the results. Also note that other error messages may be displayed in the **Console Log**.
- If you have more than one VS3000, follow the *Replacing Units in Service* procedure for your operating system to “hot-swap” VS3000 units. If this corrects the problem, the VS3000 you have removed from service may be defective or need repair.
- When all else fails, remove and reinstall the VS-Link software.

## Understanding the Ethernet LEDs

---

The following table describes Ethernet LED activity for the VS3000.

**Table 2. Ethernet LED Descriptions**

LED	Indicator	Description
10Base-T (Upper)	Flashing	Flashes briefly during transmissions from the unit as a general indicator of activity.
10Base-T (Lower)	On	VS3000 is correctly attached to the LAN by the RJ45 10Base-T connector.
10Base-T (Lower)	Off	Connected to the AUI connector or the 10Base-T connection is not connected to the LAN properly.

## Understanding the Port LEDs

The following table describes PORT LED activity after:

- VS-Link is installed and configured.
- Operating system configuration is completed for the VS3000.

**Table 3. Port LED Descriptions**

Port LEDs	Status	Description
<b>B1 or B2</b>	Off	Normal standby state - no calls pending or established.
	Flashing	B1 or B2 selected for a call, but not yet connected. A call has been initiated and the CO has assigned the B1 or B2 channel as the channel that the call will connect on. If the call connects normally, this state may not even be seen because the connection happens so fast.
	On	Call connected on B1 or B2.
<b>D</b>	Off	Line disconnected or failed. Bad Line; layer 1 not up. This can occur if the VS3000 is not connected to the CO, or if there are hardware or software problems preventing synchronization with the CO.
	Flashing	Equipment failed or not configured properly. Bad SPID; layer 1 is activated, but Layer 2 is not up yet. Layer 2 is the LAPD layer that ensures a reliable data path to the CO. In Layer 2 there is polling going on between the CO and hardware all the time. This state could indicate configuration problems.
	On	Normal activity. The VS3000 is ready for use; layer 1 and 2 are up. In this state, both B channels are available for use.

---

## Obtaining Software and Document Updates

---

For information that is not in this guide, see **README** and/or **Help** files on the installation media. In particular, the Windows NT version of VS-Link and the Windows NT ISDN Monitor program include significant online help.

Control manuals are available in electronic form on the Control web site. VS-Link software and manual updates can be downloaded at no charge from the Control ftp site. Always check the web and ftp sites to make sure that you have the current software and documentation.

The current released version of the software is stored in the **VS3000** directory. If a newer version has reached the beta testing stage, it can be found in the **BETA** directory. Beta software is made available on an **“as-is”** basis and users of beta software assume all risks and liabilities relating thereto.

**Note:** *Downloadable driver software files are stored in either zipped (filename.zip) or self-extracting zip (filename.exe) format. You must extract the zipped files and create an installation diskette before installing a downloaded file. For more information, see the appropriate section for your network operating system.*

---

## Placing a Support Call

---

Before you call Control technical support, please have the following information available. (Much of this information should already be in the **ISDN Software Installation Information** table in the *Working With The Phone Company* section of this guide.)

**Table 4. Support Call Information**

<b>Item</b>	<b>Value</b>
Operating System type and release number	
VS-Link release number	
Computer make and model	
ISDN Installation Type	<ul style="list-style-type: none"><li>o EZ-ISDN1</li><li>o 2B+D (without EKTS)</li><li>o Other _____</li></ul>
ISDN Line Type	<ul style="list-style-type: none"><li>o BRI</li></ul>
ISDN Help Desk Phone Number	
Circuit ID	

**Table 4. Support Call Information**

Item		Value	
Switch Vendor (hardware type)		<ul style="list-style-type: none"> <li>o ATT 5ESS</li> <li>o Nortel DMS-100</li> <li>o Siemens (EuroISDN)</li> </ul>	
Network Type (software)		<ul style="list-style-type: none"> <li>o National ISDN1 (NI-1)</li> <li>o ATT Custom</li> <li>o DMS-100 Proprietary (NI-1)</li> <li>o EuroISDN (NET3)</li> </ul>	
Windows NT	Novell		
<b>Port 1</b>	Primary SPID*	SPID 1*	
	Primary Directory Number**	Directory Number** 1	
	Secondary SPID	SPID 2	
	Secondary Directory Number	Directory Number 2	
<b>Port 2</b>	Primary SPID	SPID 3	
	Primary Directory Number	Directory Number 3	
	Secondary SPID	SPID 4	
	Secondary Directory Number	Directory Number 4	
<b>Port 3</b>	Primary SPID	SPID 5	
	Primary Directory Number	Directory Number 5	
	Secondary SPID	SPID 6	
	Secondary Directory Number	Directory Number 6	
<b>Port 4</b>	Primary SPID	SPID 7	
	Primary Directory Number	Directory Number 7	
	Secondary SPID	SPID 8	
	Secondary Directory Number	Directory Number 8	

- \* *The SPID (Service Provide Identifier) is an up-to-14-digit number resembling a telephone number and consisting of the SPID, SPID suffix, and TID. In some cases, your phone company may also provide you with an ISDN sub-address for each SPID. SPIDs are required for North American installations only.*
- \*\* *The Directory Number (also known as the ISDN directory number or ISDN address) is the 7-digit "local phone number" portion of the SPID.*

After you have gathered this information, contact Control:

# ISDN Cause Codes

This appendix lists ISDN cause codes and their definitions.

- Under Windows NT, ISDN cause codes are displayed and logged by the ISDN Monitor program, which is installed automatically when you install VS-Link. For more information about ISDN Monitor, see the *isdndiag* readme and ISDN Monitor help files.
- Under Novell NetWare, ISDN cause codes are sent to the console as part of driver event and error messages. For more information, see the *Novell Error Codes and Messages* section of this document.

The following table describes the ISDN cause codes in greater depth.

**Table 5. ISDN Cause Codes**

Decimal	Brief Description	Expanded Description
1	Unallocated (unassigned) number	The called party cannot be reached. (The number has a valid format but has not been assigned).
2	No route to specified transit network (national used)	The sending equipment has received a request to route the call through a transit network which it does not recognize, either because the network does not exist or because the network exists but does not serve the sending equipment.
3	No route to destination	The called party cannot be reached because the network does not serve the destination.
4	Send special information tone	The called party cannot be reached for reasons of a long-term nature. The "special information" tone is returned to the calling party.
5	Misdialed trunk prefix (national use)	Wrong trunk prefix in the called party number.
6	Channel unacceptable	The identified channel is not acceptable to the sending entity for use in this call.
7	Call awarded being delivered in an established channel	The incoming call is being connected to a channel already configured for that user (for example, packet-mode x.25 virtual calls).
8	Preemption	The call is being pre-empted.

**Table 5. ISDN Cause Codes (Continued)**

<b>Decimal</b>	<b>Brief Description</b>	<b>Expanded Description</b>
9	Preemption (circuit reserved for reuse)	The call is being pre-empted and the circuit is reserved for reuse by the pre-empting exchange.
16	Normal call clearing	The call is being cleared because one of the users participating in the call has requested that the call be cleared.
17	User busy	The called party is unable to accept another call because the user busy condition has been encountered (by the called user or by the network). If the user is busy, it is noted that the user equipment is compatible with the call.
18	No user responding	The called party does not respond to a call establishment message with either an alerting or connect indication within the allocated time period.
19	No answer from user (User alerted)	The called party has been alerted but does not respond with a connect indication within the allocated time period. This is not necessarily generated by Q.931 procedures but may be generated by internal network timers.
20	Subscriber absent	A mobile station has logged off, radio contact is not obtained with a mobile station, or a personal telecommunications user is temporarily not addressable at any user-network interface.
21	Call rejected	The equipment sending does not accept this call. The equipment is neither busy nor incompatible. This can be generated by the network, indicating that the call was cleared by a supplementary service constraint.
22	Number changed	The called-party number is no longer assigned. The new called-party number may be included in the diagnostic field.
26	Non-selected user clearing	The user has not been awarded the incoming call.
27	Destination out of order	The destination cannot be reached because the interface to the destination is not functioning. A signal message was not delivered to the remote party because of a physical layer or data link layer failure at the remote party, or the user equipment is off-line.

**Table 5. ISDN Cause Codes (Continued)**

<b>Decimal</b>	<b>Brief Description</b>	<b>Expanded Description</b>
28	Invalid number format (address incomplete)	The called party cannot be reached because the called number is not in a valid format or is not complete.
29	Facilities rejected	A requested supplementary service cannot be provided by the network.
30	Response to STATUS INQUIRY	This is a confirmation of the receipt of a STATUS INQUIRY.
31	Normal, unspecified	No other normal-class cause applies.
34	No circuit/channel available	There is no appropriate circuit/channel presently available to handle the call.
35	Call queued	The call has been queued at the central office (CO).
38	Network out of order	The network is not functioning for reasons of a long-term nature. Immediately re-placing the call is not likely to be successful.
39	Permanent frame mode connection out-of-service	Included in a STATUS message, indicating a permanently established frame mode connection is out-of-service due to equipment or section failure.
40	Permanent frame mode connection operational	The STATUS message indicates a permanently established frame mode connection is operational and capable of carrying user information.
41	Temporary failure	The network is not functioning for reasons of a short-term nature. You may attempt another call almost immediately.
42	Switching equipment congestion	The switching equipment generating this cause is experiencing a period of high traffic.
43	Access information discarded	The network could not deliver access information to the remote user as requested. That is, user-to-user information, low layer compatibility, high layer compatibility, or sub-address as indicated in the diagnostic.
44	Requested circuit/channel not available	The circuit or channel indicated by the requesting entity cannot be provided by the other side of the interface.
46	Precedence call blocked	There are no pre-emptable circuits or the called user is busy with a call of equal or higher pre-emptable level.

**Table 5. ISDN Cause Codes (Continued)**

<b>Decimal</b>	<b>Brief Description</b>	<b>Expanded Description</b>
47	Resource unavailable—unspecified	No other cause in the resource-unavailable class applies.
49	Quality of Service not available	The requested Quality of Service, as defined in the X.213 Recommendation cannot be provided (that is, throughput of transit delay cannot be supported).
50	Requested facility not subscribed	The user has requested a supplementary service which is implemented but which the user is not authorized to use. Wrong SPID.
52	Outgoing calls barred	Administratively prohibited calls.
53	Outgoing calls barred within CUG	The calling party is a member of the Closed User Group for the outgoing CUG call, but outgoing calls are not allowed for this member.
54	Incoming calls barred	No incoming calls possible; for example, a pay phone.
55	Incoming calls barred within CUG	The calling party is a member of the Closed User Group for the incoming CUG call, incoming calls are not allowed for this member.
57	Bearer capability not authorized	The user is not authorized to use the requested B channel.
58	Bearer capability not presently available	The user has requested an unavailable B channel.
62	Inconsistency in outgoing information element.	Inconsistency in the designated outgoing access information and subscriber class.
63	Service or option not available, unspecified	No other service- or option-not-available cause code applies.
65	Bearer capability not implemented	The sending equipment does not support the requested B channel.
66	Channel type not implemented	The sending equipment does not support the requested channel type.
69	Requested facility not implemented	The sending equipment does not support the requested supplementary services.
70	Only restricted digital information bearer capability is available (national use)	The calling party requested an unrestricted B channel (UDI @ 64kbps) service but the sending equipment only supports the restricted (RDI @ 56kbps) B channel version.

**Table 5. ISDN Cause Codes (Continued)**

<b>Decimal</b>	<b>Brief Description</b>	<b>Expanded Description</b>
79	Service or option not implemented, unspecified	No other service- or option-not-available cause code applies.
81	Invalid call reference value	The sending equipment has received a message with a call reference not currently in use on the user-network interface.
82	Identified channel does not exist	The sending equipment has received a request to use a channel not activated on the interface for a call. For example, if a user has subscribed to those channels on a primary rate interface numbered from 1 to 12 and the user equipment or the network attempts to use channels 13 through 23.
83	A suspended call exists, but this call identity does not	A call-resume has been attempted with a call identity that differs from that in use for any presently suspended call(s).
84	Call identity in use	The network has received a call-suspended request containing a call identity (including the null call identity) that is already in use.
85	No call suspended	The network has received a call-resume request containing a call identity element that does not indicate any suspended call within the domain of interfaces.
86	Call having the requested call identity has been cleared	The network has received a call-resume request containing a call identity information element indicating a suspended call that has in the meantime been cleared while suspended; either by the network time-out or the remote user.
87	User not a member of CUG	The called user for the incoming Closed User Group call is not a member of the specified CUG or the calling user is an ordinary subscriber calling a CUG subscriber.
88	Incompatible destination	The sending equipment has received a request to establish a call that has low/high layer compatibility or other compatibility attributes (for example, data rate) that cannot be accommodated. Another possibility is sending a DISPLAY to a station with no display feature.
90	Non-existent CUG	The specified CUG does not exist.

**Table 5. ISDN Cause Codes (Continued)**

<b>Decimal</b>	<b>Brief Description</b>	<b>Expanded Description</b>
91	Invalid transit network selection (national use)	The transit network identification is in an incorrect format as defined in Annex C/Q.931.
95	Invalid message, unspecified	No other invalid-message cause code applies.
96	Mandatory information element is missing	The information element is wrong. Typically, the switch software type has been defined incorrectly.
97*	Message type non-existent or not implemented	The sending equipment has received a message with a message type it does not recognize. Either this message is not defined or defined but not implemented.
98*	Message not compatible with call state or message type non-existent	The sending equipment received a message such that the procedures do not indicate that this is a permissible message to receive while in the call state, or a STATUS message was received indicating an incompatible call state.
99*	Information element/parameter non-existent or not implemented	The sending equipment received a message that includes information elements or parameters not recognized. The information was discarded. The information element is not required to be present in the message in order for the sending equipment to process the message.
100*	Invalid information element contents	The sending equipment received an information element that it has implemented; however, one or more fields in the I.E. are coded but not implemented. Usually indicates a wrong switch type in customer premises equipment.
101	Message not compatible with call state	A message has been received that is incompatible with the call state.
102	Recovery on timer expire	A procedure has been initiated by the termination of a timer in association with error handling procedures.

**Table 5. ISDN Cause Codes (Continued)**

<b>Decimal</b>	<b>Brief Description</b>	<b>Expanded Description</b>
103	Parameter non-existent or not implemented - passed on (national use)	The sending equipment received a message including parameters not recognized, either because they are not defined or because they are defined but not implemented. The parameters were ignored—except if the equipment sending this cause is an intermediate point, in which case the parameters pass unchanged.
110	Message with unrecognized parameter discarded	The sending equipment discarded a received message that includes a parameter that is not recognized.
111	Protocol error, unspecified	No other cause in the protocol error class applies.
127	Interworking, unspecified	An interworking call (usually a call to SW56 service) has ended.

\* The switch is programmed wrong for Cause Codes 97 through 100.

# Error Codes and System Messages

**Table 6. CAPI3000 Error Codes**

Code	Message and Description
CAPI3000	<p><i>vsservername: aaa—aaa</i></p> <p>Generic system message, where <i>aaa—aaa</i> is unfiltered administrative data from the VS3000 <i>vsservername</i>.</p>
CAPI3000 E001:	<p>Error, data block length <i>dddd</i>, must be <math>\geq</math> <i>minimum</i> and <math>\leq</math> <i>maximum</i>!</p> <p>The application specified a data block length less than the minimum (128) or greater than the maximum (4540). Data block length specifies the maximum size of a B channel data unit that can be transmitted or received. Selecting a protocol that requires larger data units, and attempting to transmit or receive larger data units, results in an error returned by the NetWare CAPI Manager [or driver]. The NetWare CAPI Manager and compliant NetWare CAPI drivers support a maximum data block length of 4540 octets.</p>
CAPI3000 E002:	<p>Error, message buffer size <i>dddd</i>, must be <math>\geq</math> <i>minimum</i> and <math>\leq</math> <i>maximum</i>!</p> <p>The application specified a message buffer size less than the minimum (1024) or greater than the maximum (9216, or ((minimum * the number of ISDN ports on a VS3000) + minimum). Message buffer size is the total of all available space the sponsoring application requires for all ports.</p>
CAPI3000 E003:	<p>Error, invalid signal type <math>\langle 0xtt \rangle</math>, must be either 'Callback' <math>\langle 0xhh \rangle</math> or 'Local Semaphore' <math>\langle 0xhh \rangle</math>!</p> <p>The inbound traffic signaling mechanism must be either Callback (when an inbound message is available, the CAPI driver stack calls a specified application notification function, supplying the application context value; the application then should retrieve the message by calling the CAPI_GetMessage function), or Local Semaphore (when an inbound message is available, the CAPI driver stack signals the local semaphore causing the application process to wake up and retrieve the message by calling the CAPI_GetMessage function). Other signalling mechanisms are not recognized.</p>

**Table 6. CAPI3000 Error Codes**

<b>Code</b>	<b>Message and Description</b>
CAPI3000 E004:	<p>Error, cannot register more than <i>n</i> applications, rejected!</p> <p>Since buffer pools and other resources are dedicated to each particular application, more than a certain number would have adverse impact on performance. This console message indicates that an application has attempted to register with the VS3000 stack after all available application slots were registered.</p> <p><b>Note:</b> PPP is considered one application</p>
CAPI3000 E005:	<p>Error allocating application control structure!</p> <p>Application registration failed due to lack of available memory. Error returned to CAPI, registration failed.</p>
CAPI3000 E006:	<p>Error, illegal Application ID <i>nn</i>!</p> <p>Release by unrecognized application failed, application identifier is too large, should be from the set {0-3}. Error returned to CAPI, registration failed.</p>
CAPI3000 E007:	<p>Error, application not found for ID <i>nn</i>!</p> <p>Release by unrecognized application failed, application identifier was not in use. Error returned to CAPI, registration failed.</p>
CAPI3000 E008:	<p>Error, stale Application ID <i>nn</i>!</p> <p>Release by unrecognized application failed, application identifier supplied by application didn't match one retained by VS3000 ISDN driver. Error returned to CAPI, registration failed.</p>
CAPI3000 E009:	<p>Error, invalid CAPI subcommand &lt;0x<i>hh</i>&gt;!</p> <p>The CAPI subcommand (properly either a request or response) was unrecognized and the command was discarded with an error response to CAPI. Valid subcommands are {80, 81, 82, 83}.</p>
CAPI3000 E010:	<p>Insufficient memory available for virtual server information!</p> <p>Couldn't allocate sufficient space for interface configuration data. Fatal, since driver initialization fails.</p>

**Table 6. CAPI3000 Error Codes**

<b>Code</b>	<b>Message and Description</b>
CAPI3000 E011:	<p>Registration of virtual server #<i>n</i> failed, reason &lt;0xhh&gt;!</p> <p>Registration of VS3000 ISDN driver with the CAPI Manager failed. Fatal, since driver initialization fails.</p> <p>If reason = 1001, too many applications.</p> <p>If reason = 1002, invalid block size.</p> <p>If reason = 1003, invalid buffer size.</p> <p>If reason = 1004, invalid message buffer.</p> <p>If reason = 1005, invalid connect number.</p> <p>If reason = 1006, busy.</p> <p>If reason = 1007, OS resource error.</p> <p>If reason = 1008, CAPI not installed.</p> <p>If reason = 1009, no external equipment.</p> <p>If reason = 100A, no internal equipment.</p> <p>If reason = 100B, invalid signal type.</p> <p>If reason = 10F0, too many applications.</p> <p>If reason = 10F1, invalid function array.</p> <p>If reason = 10F2, invalid controller information.</p> <p>No other reason codes are defined.</p>
CAPI3000 E012:	<p>All <i>n</i> possible InterChangeVS 3000 virtual servers already installed!</p> <p>Maximum number of VS3000 units have been attached to and configured for this server. Check server configuration to determine why so many VS3000s are enabled.</p>
CAPI3000 E013:	<p>Request for NetWare resource tags failed!</p> <p>Fatal error. The VS3000 driver cannot allocate resources unless NetWare allows, which NetWare does by issuing 'resource tags.'</p>
CAPI3000 E014:	<p>Couldn't attach polling procedure!</p> <p>The VS3000 driver could not activate its background idle process. Fatal error.</p>
CAPI3000 E015:	<p>No identifiable 'CAPINAME=' parameter!</p> <p>The VS3000 driver load line did not contain a VS3000 configuration name.</p>
CAPI3000 E016:	<p>Requested virtual server name (<i>aaaaaaaa</i>) is already in use!</p> <p>Attempted to load a VS3000 already initialized and configured.</p>
CAPI3000 E017:	<p>Path <i>pppppppp</i> to configuration directory not found!</p> <p>Could not retrieve a VS3000 configuration file because the Control-unique directory does not exist. Rerun the configuration utility and save the configuration file.</p>

**Table 6. CAPI3000 Error Codes**

<b>Code</b>	<b>Message and Description</b>
CAPI3000 E018:	Configuration path <i>pppppppp</i> not found!  Could not retrieve a VS3000 configuration file because the file at path <i>pppppppp</i> does not exist. Rerun the configuration utility and save the configuration file.
CAPI3000 E019:	Read error <0x <i>hh</i> > on configuration file <i>aaaaaaaa</i> !  The system returned an error 0x <i>hh</i> while attempting to read the specified configuration file. <i>hh</i> = 01: no such file. <i>hh</i> = 06: permission denied. <i>hh</i> = 09: invalid file name. No other error codes are defined.
CAPI3000 E020:	Configuration file <i>aaaaaaaa</i> length <i>nnnn</i> , should be <i>mmmm</i> !  The specified file is either corrupted, not current with the driver version, or not a configuration file. Rerun VS3000 configuration utility, making sure the configuration utility version is current with the VS3000 driver version.
CAPI3000 E021:	Configuration file <i>aaaaaaaa</i> read error, read <i>nnnn</i> of <i>mmmm</i> bytes!  The specified file read was terminated, since it appeared that the file would overrun the configuration file buffer.
CAPI3000 E022:	Configuration file <i>aaaaaaaa</i> in obsolete version <i>nnnn</i> , should be <i>mmmm</i> !  The specified file is not current with the driver version. Rerun VS3000 configuration utility, making sure the configuration utility version is current with the VS3000 driver version.
CAPI3000 E023:	SPID1 and DN1 are required in configuration <i>aaaaaaaa</i> for proper operation!  At this time the VS3000 driver requires at least one SPID/DN pair to be specified, and this pair must be Service Profile ID 1 / Directory Number 1. Not applicable to EuroISDN networks.
CAPI3000 E024:	Configuration <i>aaaaaaaa</i> 's SPID <i>n</i> requires specification of DN <i>n</i> !  Every specified Service Profile ID requires a corresponding Directory Number. Not applicable to EuroISDN networks.

Table 6. CAPI3000 Error Codes

Code	Message and Description
CAPI3000 E025:	<p>Configuration <i>aaaaaaaa</i>'s DN<i>n</i> requires specification of SPID<i>n</i>!</p> <p>Every specified Directory Number requires a corresponding SPID. Not applicable to EuroISDN networks.</p>
CAPI3000 E026:	<p>Configuration <i>aaaaaaaa</i> has no valid SPID/DN pairs, at least one valid pair required!</p> <p>Every specified Service Profile ID requires a corresponding Directory Number, and vice versa. Not applicable to EuroISDN networks.</p>
CAPI3000 E027:	<p>Unable to allocate <i>nnnn</i> bytes for default firmware, Virtual Server <i>aaaaaaaa</i> not loaded!</p> <p>Unable to allocate enough space for the VS3000 firmware buffer.</p>
CAPI3000 E028:	<p>Path <i>pppppppp</i> to Control directory not found, Virtual Server <i>aaaaaaaa</i> not loaded!</p> <p>Could not find the Control-unique directory, therefore unable to load the VS3000 firmware that would be present in that directory. Fatal, as driver won't default to standard driver. If the standard driver is acceptable, reconfigure the VS3000 to remove the optional firmware file name and restart the server.</p>
CAPI3000 E029:	<p>Firmware pathname <i>pppppppp</i> not found, Virtual Server <i>aaaaaaaa</i> not loaded!</p> <p>Could not find the optional firmware file in the Control-unique directory, therefore unable to load the VS3000 firmware. Fatal, as driver won't default to standard driver. If the standard driver is acceptable, reconfigure the VS3000 to remove the optional firmware file name and restart the server.</p>
CAPI3000 E030:	<p>Read error &lt;0x<i>hh</i>&gt; on firmware file <i>bbbbbbbb</i>, Virtual Server <i>aaaaaaaa</i> not loaded!</p> <p>The system returned an error while attempting to read the optional firmware file. Fatal, as driver won't default to standard driver. If the standard driver is acceptable, reconfigure the VS3000 to remove the optional firmware file name and restart the server.</p>

**Table 6. CAPI3000 Error Codes**

<b>Code</b>	<b>Message and Description</b>
CAPI3000 E031:	<p>Unable to allocate <i>nnnn</i> bytes for firmware file <i>bbbbbbbb</i>, Virtual Server <i>aaaaaaaa</i> not loaded!</p> <p>Could not allocate sufficient space for the optional firmware file <i>firmware</i>. Fatal, as driver won't default to standard driver. If the standard driver is acceptable, reconfigure the VS3000 to remove the optional firmware file name and restart the server.</p>
CAPI3000 E032:	<p>Read error on firmware file <i>bbbbbbbb</i>, Virtual Server <i>aaaaaaaa</i> not loaded!</p> <p>System returned an error attempting to read the optional firmware file. Fatal, as driver won't default to standard driver. If the standard driver is acceptable, reconfigure the VS3000 to remove the optional firmware file name and restart the server.</p>
CAPI3000 E033:	<p>Unable to unload driver - connections still active!</p> <p>Driver unload failed, since calls are still active. The driver cannot force calls down. That must be done by the owning application or by Novell Call Manager.</p>
CAPI3000 E034:	<p>Virtual Server <i>aaaaaaaa</i> (#<i>dd</i>) de-registration failed!</p> <p>Unable to deregister the driver from the application. Server may need to be brought down and back up.</p>
CAPI3000 E035:	<p>Error allocating CAPI Data Buffer pool (<i>nnnn</i> bytes)!</p> <p>Insufficient space for inbound data buffer pool. This pool is built on an application basis using the values passed from the application and CAPI manager at registration, and is related to the Command Buffer pool. Fatal.</p>
CAPI3000 E036:	<p>Error allocating CAPI Command Buffer Pool (<i>nnnn</i> bytes)!</p> <p>Insufficient space for outbound inbound buffer pool of <i>nnnn</i> bytes. This pool is built on an application basis using the values passed from the application and CAPI manager at registration, and is related to the CAPI Data Buffer pool. Fatal.</p>
CAPI3000 E037:	<p>Error allocating buffer header pool (<i>nnnn</i> bytes)!</p> <p>Insufficient space for outbound buffer headers of <i>nnnn</i> bytes. This pool is built on an application basis. Fatal.</p>

**Table 6. CAPI3000 Error Codes**

Code	Message and Description
CAPI3000 E038:	<p>Error allocating ECB pool (<i>nnnn</i> bytes)!</p> <p>Insufficient space for inbound ECB parking area of <i>nnnn</i> bytes. This pool is built on an application basis based on the number of outstanding packets per ISDN channel. Fatal.</p>
CAPI3000 E100:	<p>Unable to allocate transmit ECB, status &lt;0x<hhhhhhhh&gt;, <i="" nic="">dd!</hhhhhhhh&gt;,></p> <p>No ECBs were available for issuing a transmit VS3000 control request on NIC card <i>dd</i>. May need to use Novell system configuration utilities to allocate more ECBs. NIC driver may be holding on to ECBs too long.</p> <p>If <i>hhhhhhh</i> = FFFFFFFF89, either the packet size exceeded the maximum ECB size or an ECB was not available. No other statuses are defined.</p>
CAPI3000 E101:	<p>Unable to set Protocol ID, status &lt;0x<hhhhhhhh&gt;, <i="" nic="">dd!</hhhhhhhh&gt;,></p> <p>The LSLGetPIDFromStackIDBoard system function returned an error code for NIC card <i>dd</i> while attempting to determine the stack ID before sending a VS3000 control message.</p> <p>If <i>hhhhhhh</i> = 0FFFFFFF82, either the protocol Stack ID or the board number does not exist.</p> <p>If <i>hhhhhhh</i> = 0FFFFFFF85, no Protocol ID is associated with the parameters passed.</p> <p>No other statuses are defined.</p>
CAPI3000 E102:	<p>Unable to transmit packet, status &lt;0x<hhhhhhhh&gt;, <i="" nic="">dd!</hhhhhhhh&gt;,></p> <p>Send of VS3000 control message to NIC card <i>dd</i> failed. If <i>hhhhhhh</i> = 0FFFFFFF85, the NIC number <i>dd</i> is invalid. No other statuses are defined.</p>
CAPI3000 E200:	<p>Oversize (<i>dddd</i>) ASI command for Virtual Server <i>aaaaaaaa</i>!</p> <p>An attempt was made to send a too-large ASI D-channel message to VS3000 unit <i>aaaaaa</i>. The size was <i>dddd</i>. The request was rejected.</p>
CAPI3000 E201:	<p>Buffers unavailable for sending D channel data to Virtual Server <i>aaaaaaaa</i>/Port <i>n</i>!</p> <p>Insufficient system buffers were available to issue a send request to the D-channel on VS3000 <i>aaaaaaaa</i> Port <i>n</i>. The request was rejected.</p>

**Table 6. CAPI3000 Error Codes**

<b>Code</b>	<b>Message and Description</b>
CAPI3000 E202:	<p>No ECBs available to send ASI packet to Virtual Server <i>aaaaaaaa</i> via NIC <i>dd</i>!</p> <p>No ECBs were available to issue an ASI D-channel command to VS3000 <i>aaaaaaaa</i> attached to NIC card <i>dd</i>. The request was rejected.</p>
CAPI3000 E203:	<p>Couldn't acquire Protocol ID from LSL, Virtual Server <i>aaaaaaaa</i>/NIC <i>dd</i>!</p> <p>An attempt was made to send a D-channel message that was too large to VS3000 <i>aaaaaaaa</i> attached to NIC card <i>dd</i>. The request was rejected.</p>
CAPI3000 E204:	<p>Send ASI packet failed to Virtual Server <i>aaaaaaaa</i> via NIC <i>dd</i>, status &lt;0x<h>hhhhhhh</h>&gt;!</p> <p>An ASI D-channel send request to VS3000 <i>aaaaaaaa</i> attached to NIC card <i>dd</i> was rejected. If <i>hhhhhhh</i> = 0FFFFFF85, the NIC number <i>dd</i> is invalid. No other statuses are defined.</p>
CAPI3000 E205:	<p>Transmit complete, but no call entry match for Virtual Server <i>aaaaaaaa</i>/Port <i>p/Bn</i>!</p> <p>An ASI B channel send request completed, but no call was active on VS3000 <i>aaaaaaaa</i>, port <i>p</i>, channel <i>Bn</i>. Request was rejected.</p>
CAPI3000 E206:	<p>Received <i>Bn</i> data lost, no call entry match for Virtual Server <i>aaaaaaaa</i>/Port <i>p</i>!</p> <p>An ASI B channel message was received, but no call was active on VS3000 <i>aaaaaaaa</i>, port <i>p</i>, channel <i>Bn</i>. Message was discarded.</p>
CAPI3000 E207:	<p>Received <i>Bn</i> data lost from Virtual Server <i>aaaaaaaa</i>/Port <i>p</i>, application inactive!</p> <p>An ASI B channel message was received on VS3000 <i>aaaaaaaa</i>, port <i>p</i>, but no application was active and available for that message. Message was discarded.</p>
CAPI3000 E208:	<p>Received <i>Bn</i> data from Virtual Server <i>aaaaaaaa</i>/Port <i>p</i> lost, no ECB slots available for application <i>dd</i>!</p> <p>An ASI B channel message was received on VS3000 <i>aaaaaaaa</i>, port <i>p</i>, but the receive window on that particular port was closed. Message was discarded.</p>
CAPI3000 E209:	<p>Unidentified ASI command &lt;0x<h>hh</h>&gt; received from Virtual Server <i>aaaaaaaa</i>!</p> <p>An apparent ASI message was received, but the type could not be identified. Message was discarded.</p>

Table 6. CAPI3000 Error Codes

Code	Message and Description
CAPI3000 E210:	<p>ASI <i>command_type</i>: Virtual Server <i>aaaaaaaa</i>/Port <i>p/Bn</i> Invalid PEI &lt;0x<hhhh&gt;!< p=""> <p>A <i>command_type</i> was received from an application or CAPI Manager for VS3000 <i>aaaaaaaa</i>, port <i>p</i>, channel <i>Bn</i>, but no connection had been defined yet for that Program Entity ID. Message discarded.</p> <p><b>Valid <i>command_types</i>:</b>  Connect Request  More Info Indication  Event Indication  Connect Confirmation  Disconnect Confirmation  Disconnect Indication</p> </hhhh&gt;!<></p>
CAPI3000 E211:	<p>ASI <i>command_type</i> Cause: Virtual Server <i>aaaaaaaa</i>/Port <i>p/Bn</i>: Unknown or invalid ASI cause code &lt;0x<hh&gt;!< p=""> <p>A <i>command_type</i> message related to the specified channel but containing an unidentified ASI cause code was received from VS3000 <i>aaaaaaaa</i>, port <i>p</i>, channel <i>Bn</i>.</p> </hh&gt;!<></p>
CAPI3000 E212:	<p>ASI <i>command_type</i> Cause: Virtual Server <i>aaaaaaaa</i>/Port <i>p/Bn</i>: <i>ccc...ccc</i></p> <p>A <i>command_type</i> message related to VS3000 <i>aaaaaaaa</i>, port <i>p</i>, channel <i>Bn</i>, occurred because of cause <i>ccc...ccc</i>. For more information, see the ISDN Cause Codes appendix.</p>
CAPI3000 E215:	<p>ASI Event Indication: Virtual Server <i>aaaaaaaa</i>/Port <i>p</i>: Cannot find event type!</p> <p>An ASI Event Indication was received from VS3000 <i>aaaaaaaa</i>, port <i>p</i>, but no event type could be located within the message</p>
CAPI3000 E216:	<p>ASI Connect Indication: Virtual Server <i>aaaaaaaa</i>/Port <i>p</i>: Duplicate AEI &lt;0x<hhhhhhhh&gt;!< p=""> <p>An ASI Connect Indication message was received from VS3000 <i>aaaaaaaa</i>, port <i>p</i>, but a call with the specified Program Entity ID was already in progress.</p> </hhhhhhhh&gt;!<></p>
CAPI3000 E217:	<p>ASI Connect Indication: Virtual Server <i>aaaaaaaa</i>/Port <i>p</i>: Cannot accept new call at this time, disconnecting!</p> <p>An ASI Connect Indication was received from VS3000 <i>aaaaaaaa</i>, port <i>p</i>, but all possible calls were already in progress.</p>

**Table 6. CAPI3000 Error Codes**

<b>Code</b>	<b>Message and Description</b>
CAPI3000 E218:	<p>ASI Connect Indication: Virtual Server <i>aaaaaaaa</i>/Port <i>p</i>: Unable to locate Block Type!</p> <p>An ASI Connect Indication was received from VS3000 <i>aaaaaaaa</i>, port <i>p</i>, but no block type could be located within the message.</p>
CAPI3000 E219:	<p>ASI Connect Indication: Virtual Server <i>aaaaaaaa</i>/Port <i>p</i>: Unable to locate Channel Preferences!</p> <p>An ASI Connect Indication was received from VS3000 <i>aaaaaaaa</i>, port <i>p</i>, but no channel preferences could be located within the message.</p>
CAPI3000 E220:	<p>ASI Connect Indication: Virtual Server <i>aaaaaaaa</i>/Port <i>p</i>: Unsupported call type &lt;0xtt&gt; PEI &lt;0xgggg&gt; AEI &lt;0xhhhh&gt;</p> <p>An ASI Connect Indication was received from VS3000 <i>aaaaaaaa</i>, port <i>p</i>, but the specified call type <i>tt</i> was not identified and could not be supported for Program Entity ID <i>gggg</i>, Application Entity ID <i>hhhh</i>.</p>
CAPI3000 E221:	<p>ASI Connect Indication: Virtual Server <i>aaaaaaaa</i>/Port <i>p</i>: No CAPI Listen received previously PEI &lt;0xgggg&gt; AEI &lt;0xhhhh&gt;</p> <p>An ASI Connect Indication was received from VS3000 <i>aaaaaaaa</i>, port <i>p</i>, but the call was rejected since no listen command had yet been issued for Program Entity ID <i>gggg</i>, Application Entity ID <i>hhhh</i>.</p>
CAPI3000 E225:	<p>Virtual Server <i>aaaaaaaa</i> in <i>sss...sss</i> state, unavailable for output!</p> <p>An attempt to issue a D-channel output to VS3000 <i>aaaaaaaa</i> was rejected because the VS3000 is currently in state <i>sss...sss</i> of the VS3000. Message discarded.</p>
